Introduction

The Event Generator is responsible of creating and sending out timing events to an array of Event Receivers. High configurability makes it feasible to build a whole timing system with a single Event Generator without external counters etc.

Events are sent out by the event generator as event frames (words) which consist of an eight bit event code and an eight bit distributed bus data byte. The event transfer rate is derived from an external RF clock or optionally an on-board clock generator. The optical event stream transmitted by the Event Generator is phase locked to the clock reference.

There are several sources of events: trigger events, sequence events, software events and events received from an upstream Event Generator. Events from different sources have different priority which is resolved in a priority encoder.

In addition to events the Event Generator enables the distribution of eight simultaneous signals sampled with the event clock rate, the distributed bus. Distributed bus signals may be provided externally or generated on-board by programmable multiplexed counters.

Event Stream Details

The structure of the event stream is described to help understand the functioning of the event system. The event stream should be considered as a continuous flow of event frames which consist of two bytes, the event code and distributed bus data byte.

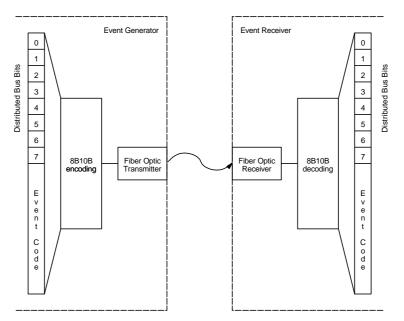

Figure 1: Event Frame

Event Codes

There are 256 event codes from which a few have special functions. The special function event codes are listed below. Only one event code may be transferred at a time. If there is no event code to be transferred, the null event code (0x00) is transmitted. Every now and then a special 8B10B

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 5 of 50

character K28.5 is transmitted instead of the null event code. The K28.5 comma character is transmitted to allow the event receivers to synchronise on the correct word boundary is the serial bit stream.

Event Code	Code Name	EVG Function	EVR Function
0x00	Null Event Code	-	-
0x01 - 0x6F	-	User Defined	User Defined
0x70	Seconds '0'	-	Shift in '0' to LSB of
			Seconds Shift Register
0x71	Seconds '1'	-	Shift in '1' to LSB of
			Seconds Shift Register
0x72 - 0x79	-	User Defined	User Defined
0x7A	Heartbeat	-	Reset Heartbeat Monitor
0x7B	Synchronise Prescalers	-	Synchronise Prescaler
			Outputs
0x7C	Timestamp Counter	-	Increment Timestamp
	Increment		Counter
0x7D	Timestamp Counter Reset	-	Reset Timestamp Counter
0x7F	End of Sequence	Stop Sequence	-
0x80-FF	-	User Defined	User Defined

Distributed Bus and Data Transmission

The distributed bus allows transmission of eight simultaneous signals with the event clock rate time resolution (10 ns at 100 MHz event clock rate). The source for distributed bus signals may come from an external source or the signals may be generated with programmable multiplexed counters (MXC) inside the event generator. The distributed bus signals may be programmed to be available as hardware outputs on the event receiver.

In latest firmware versions the distributed bus bandwidth may be shared by transmission of a configurable size data buffer to up to 2 kbytes. When data transmission is enabled the distributed bus bandwidth is halved. The remaining bandwidth is reserved for transmitting data with a speed up to 50 Mbytes/s (event clock rate divided by two).

Event Sources

Trigger Events

There are eight trigger event sources that send out an event code on a stimulus. Each trigger event has its own programmable event code register and various enable bits. The event code transmitted is determined by contents of the corresponding event code register. The stimulus may be a detected rising edge on an external signal or a rising edge of a multiplexed counter output.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 6 of 50

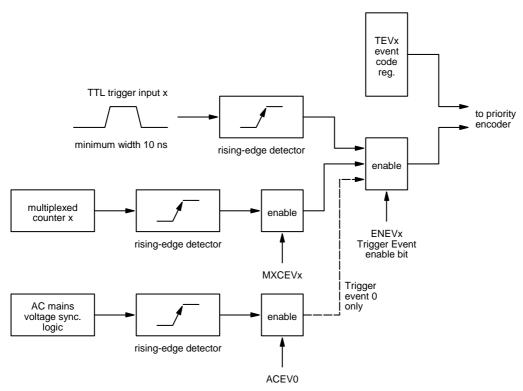

Figure 2: Trigger Events

Trigger Event 0 has also the option of being triggered by a rising edge of the AC mains voltage synchronization logic output signal.

The external input accepts TTL level signals. The input logic is edge sensitive and the signals are synchronized internally to the event clock.

Upstream Events

Event Generators may be cascaded. The event generator receiver includes a first-in-first-out (FIFO) memory to synchronize incoming events which may be synchronized to a clock unrelated to the event clock. Usually there are no events in the FIFO. An event code from an upstream EVG is transmitted as soon as there is no other event code to be transmitted.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 7 of 50

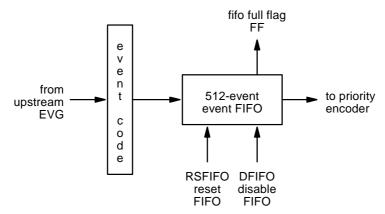

Figure 3: Upstream Event FIFO

Event Sequencer

Event sequencers provide a method of transmitting or playing back sequences of events stored in random access memory with defined timing. In the event generator there are two event sequencers. The 8-bit event codes are stored in a RAM table each attached with a 32-bit timestamp relative to the start of sequence. Both sequencers can hold up to 2048 event code – timestamp pairs.

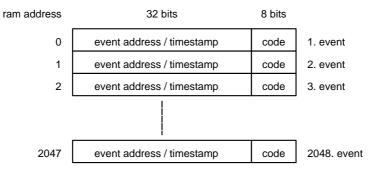

Figure 4: Sequencer RAM Structure

The contents of a sequencer RAM may be altered at any time, however, it is recommended only to modify RAM contents when the RAM is disabled. The sequencer runs at the event clock rate to up to 100 MHz.

The Sequencers may be triggered from several sources including software triggering, triggering on a multiplexed counter output or AC mains voltage synchronization logic output.

The sequencers are enabled by writing a '1' bit to SQxEN in the Sequence RAM control Register. The RAMs may be disabled any time by writing a '1' to SQxDIS bit. Disabling sequence RAMs does not reset the RAM address and timestamp registers. By writing a '1' to the bit SQxRES in the Control Register the sequencer is both disabled and the RAM address and timestamp register is reset.

When the sequencer is triggered the internal event address counters starts counting. The counter value is compared to the event address of the next event in the RAM table. When the counter value matches or is greater than the timestamp in the RAM table, the attached event code is

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 8 of 50

transmitted. The time offset between two consecutive events in the RAM is allowed to be 1 to 2^{32} sequence clock cycles i.e. the internal event address counter rolls over when to 0 when 0xffffffff is reached.

There are two special event codes which are not transmitted, the null event code 0x00 and end sequence code 0x7f. The null event code may be used if the time between two consecutive events should exceed 2^{32} event clock cycles by inserting a null event with a timestamp value of 0xffffffff. The end sequence code resets the sequencer RAM table address and timestamp register and depending on configuration bits, disables the sequencer (single sequence, SQxSNG=1) or restarts the sequence either immediately (recycle sequence, SQxREC=1) or waits for a new trigger (SQxREC=0).

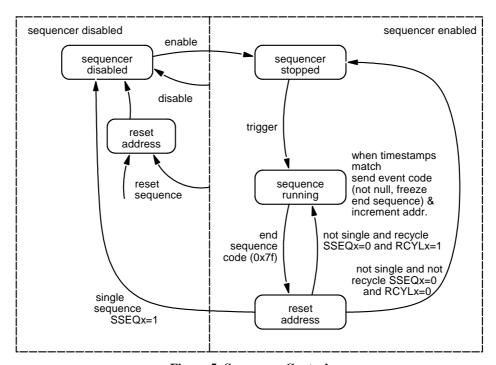

Figure 5: Sequencer Control

Sequencer Interrupt Support

The sequencers provide two interrupts: a sequence start and sequence stop interrupt. The sequence start interrupt is issued when a sequencer is in enabled state, gets triggered and was not running before the trigger.

A sequence stop interrupt is issued when the sequence is running and reaches the 'end of sequence' code.

Distributed Bus

The bits of the distributed bus are sampled at the event rate from external signals; alternatively the distributed bus signals may be generated by multiplexed counter outputs. If there is an upstream EVG, the state of all distributed bus bits may be forwarded by the EVG.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 9 of 50

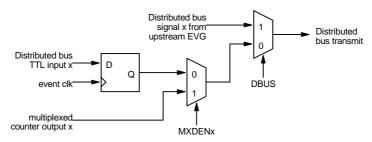

Figure 6: Distributed Bus

Timestamping Inputs

Staring from firmware version E306 a few distributed bus input signals have dual function: transition board input DBUS5-7 can be used to generate special event codes controlling the timestamping in Event Receivers.

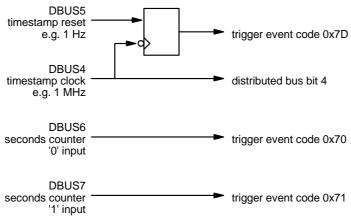

Figure 7: Timestamping Inputs

The two clocks, timestamp clock and timestamp reset clock, are assumed to be rising edge aligned. In the EVG the timestamp reset clock is sampled with the falling edge of the timestamp clock. This is to prevent a race condition between the reset and clock signals. In the EVR the reset is synchronised with the timestamp clock.

The two seconds counter events are used to shift in a 32-bit seconds value between consecutive timestamp reset events. In the EVR the value of the seconds shift register is transferred to the seconds counter at the same time the higher running part of the timestamp counter is reset.

The distributed bus event inputs can be enabled independently through the distributed bus event enable register. The events generated through these distributed bus input ports are given lowest priority.

Multiplexed Counters

Eight 32-bit multiplexed counters generate clock signals with programmable frequencies from event clock/2³²-1 to event clock/2. Even divisors create 50% duty cycle signals. The counter outputs may be programmed to trigger events, drive distributed bus signals and trigger sequence RAMs. The output of multiplexed counter 7 is hard-wired to the mains voltage synchronization logic.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 10 of 50

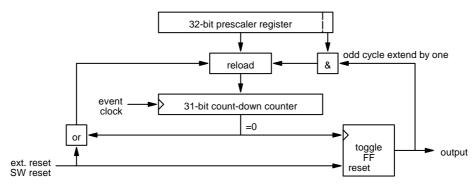

Figure 8: Multiplexed Counter

Each multiplexed counter consists of a 32-bit prescaler register and a 31-bit count-down counter which runs at the event clock rate. When count reaches zero, the output of a toggle flip-flop changes and the counter is reloaded from the prescaler register. If the least significant bit of the prescaler register is one, all odd cycles are extended by one clock cycle to support odd dividers.

Prescaler value	Duty Cycle	Frequency at 125 MHz Event
		Clock
0, 1 not allowed	undefined	undefined
2	50/50	62.5 MHz
3	33/66	41.7 MHz
4	50/50	31.25 MHz
5	40/60	25 MHz
$2^{32}-1$	approx. 50/50	0.029 Hz

The multiplexed counters may be reset by software or hardware input. The reset state is defined by the multiplexed counter polarity register.

Configurable Size Data Buffer

Starting from firmware version E305 transmission of a configurable size data buffer over the event system link is possible. The buffer size can be programmed in four byte increments (long words) from 4 bytes to 2048 bytes.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 11 of 50

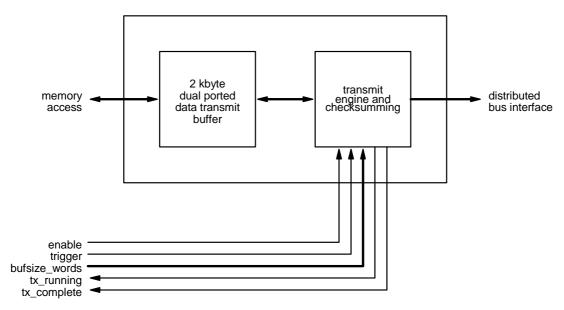

Figure 9: Configurable size transmit data buffer

When the EVG is configured for data transmission (mode = 1 in data buffer control register) the bandwidth of the distributed bus is shared with data transmission: half of the bandwidth remains for the distributed bus and the other half is reserved for data transmission.

The data to be transmitted is stored in a 2 kbyte dual-ported memory starting from the lowest address 0. This memory is directly accessible from VME. The transfer size is determined by *bufsize* register bits in four byte increments. The transmission is trigger by software. Two flags *tx_running* and *tx_complete* represent the status of transmission.

Transmission utilises two K-characters to mark the start and end of the data transfer payload, the protocol looks following:

8B10B-character	Description
K28.0	Start of data transfer
Dxx.x	1 st data byte (address 0)
Dxx.x	2 nd data byte (address 1)
Dxx.x	3 rd data byte (address 2)
Dxx.x	4 th data byte (address 3)
Dxx.x	n th data byte (address n-1)
K28.1	End of data
Dxx.x	Checksum (LSB)
Dxx.x	Checksum(MSB)

Table 1: Data Transmission Protocol

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 12 of 50

Programmable Front Panel Connections

The front panel outputs are programmable: multiplexed counters and distributed bus bits can be mapped to any output. The mapping is shown in table below.

Table 2: Signal mapping IDs

Mapping ID	Signal
0 to 31	(Reserved)
32	Distributed bus bit 0 (DBUS0)
39	Distributed bus bit 7 (DBUS7)
40 to 61	(Reserved)
62	Force output high (logic 1)
63	Force output low (logic 0)

AC Line Synchronisation

The Event Generator provides synchronization to the mains voltage frequency or another external clock. The mains voltage frequency can be divided by an eight bit programmable divider. The output of the divider may be delayed by 0 to 25.5 ms by a phase shifter in 0.1 ms steps to be able to adjust the triggering position relative to mains voltage phase. After this the signal synchronized to the event clock or the output of multiplexed counter 7.

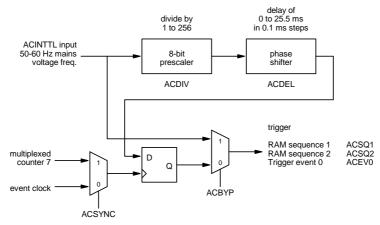

Figure 10: AC Input

The phase shifter operates with a clock of 1 MHz which introduces jitter. If the prescaler and phase shifter are not required this circuit may be bypassed. This also reduces jitter because the external trigger input is sampled directly with the event clock.

Event Clock

All operations on the event generator are synchronised to the event clock which is derived from an externally provided RF clock. For laboratory testing purposes an on-board fractional synthesiser may be used to deliver the event clock. The serial link bit rate is 20 times the event clock rate. The acceptable range for the event clock and bit rate is shown in the following table.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 13 of 50

	Event Clock	Bit Rate
Minimum	50 MHz	1.0 Gb/s
Maximum	125 MHz	2.5 Gb/s

Note: maximum event clock for cPCI-EVG-220 is 100 MHz with 2.0 Gb/s bit rate

During operation the reference frequency should not be changed more than ± 100 ppm.

RF Clock and Event Clock

The event clock may be derived from an external RF clock signal. The front panel RF input is 50 ohm terminated and AC coupled to a LVPECL logic input, so either an ECL level clock signal or sine-wave signal with a level of maximum +10 dBm can be used.

Divider	RF Input Frequency	Event Clock	Bit Rate

Fractional Synthesiser

For laboratory testing purposes the event clock may be generated on-board the event generator using a fractional synthesiser. A Micrel (http://www.micrel.com) SY87739L Protocol Transparent Fractional-N Synthesiser with a reference clock of 24 MHz is used. The following table lists programming bit patterns for a few frequencies.

Event Rate	Configuration Bit	Reference Output	Precision
	Pattern	_	(theoretical)
499.8 MHz/4	0x00FE816D	124.95 MHz	0
= 124.95 MHz			
499.654 MHz/4	0x0C928166	124.907 MHz	-52 ppm
= 124.9135 MHz

Programming Details

VME-EVG-230 CR/CSR Support

The VME Event Generator module provides CR/CSR Support as specified in the VME64x specification. The CR/CSR Base Address Register is determined after reset by the inverted state of VME64x P1 connector signal pins GA4*-GA0*. In case the parity signal GAP* does not match the GAx* pins the CR/CSR Base Address Register is loaded with the value 0xf8 which corresponds to slot number 31.

Note: the board can be used in standard VME crates where geographical pins do not exist, in this case the user may either insert jumpers to set the geographical address or use the default setting when the board's CR/CSR base address will be set to 0xf8.

After power up or reset the board responds only to CR/CSR accesses with its geographical address. Prior to accessing Event Generator functions the board has to be configured by accessing the boards CSR space.

The Configuration ROM (CR) contains information about manufacturer, board ID etc. to identify boards plugged in different VME slots. The following table lists the required field to locate an Event Generator module.

CR address	Register	EVG
0x27, 0x2B, 0x2F	Manufacturer's ID (IEEE OUI)	0x000EB2
0x33, 0x37, 0x3B, 0x3F	Board ID	0x454700E6

For convenience functions are provided to locate VME64x capable boards in the VME crate.

```
STATUS vmeCRFindBoard(int slot, UINT32 ieee_oui, UINT32 board_id, int *p_slot);
```

To locate the first Event Generator in the crate starting from slot 1, the function has to be called following:

```
#include "vme64x_cr.h"
int slot = 1;
int slot_evg;
vmeCRFindBoard(slot, 0x000EB2, 0x454700E6, &slot_evg);
or
vmeCRFindBoard(slot, MRF_IEEE_OUI, MRF_4CHTIM_BID, &slot_evg);
```

If this function returns OK, an Event Generator board was found in slot slot_evg.

Function 0/1/2 Registers

The Event Generator specific register are accessed via Function 0, 1 or 2 as specified in the VME64x specification. To enable Function 0, the address decoder compare register for Function 0 in CSR space has to be programmed. For convenience a function to perform this is provided:

```
STATUS vmeCSRWriteADER(int slot, int func, UINT32 ader);
```

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 20 of 50

To configure Function 0 of an Event Generator board in slot 3 to respond to A16 accesses at the address range 0x1800-0x1FFF the function has to be called with following values:

```
vmeCSRWriteADER(3, 0, 0x18A4);
```

ADER contents are composed of the address mask and address modifier, the above is the same as:

```
vmeCSRWriteADER(3, 0, (slot << 11) | (VME_AM_SUP_SHORT_IO << 2));</pre>
```

To get the memory mapped pointer to the configured Function 0 registers on the Event Generator board the following VxWorks function has to be called:

Note: using the data transmission capability requires reserving more than 4 kbytes for function 0 i.e. use of addressing mode A24 is suggested, following:

Välitalontie 83 C, FI-00660 Helsinki, Finland

Page: 21 of 50

VME-EVG-230 Network Interface

A 10baseT network interface is provided to upgrade the FPGA firmware and set up boot options. It is also possible to control the module over the network interface.

Assigning an IP Address to the Module

By default the modules uses DHCP (dynamic host configuration protocol) to acquire an IP address. In case a lease cannot be acquired the IP address set randomly in the 169.254.x.x subnet. The board can be programmed to use a static address instead if DHCP is not available.

The module can be located looking at the lease log of the DHCP server or using a Windows tool called Locator.exe.

Using Telnet to Configure Module

To connect to the configuration utility of the module issue the following command:

telnet 192.168.1.32 23

The latter parameter is the telnet port number and is required in Linux to prevent negotiation of telnet parameters which the telnet server of the module is not capable of.

The telnet server responds to the following commands:

Command	Description	
b	Show/change boot parameters, IP address etc.	
d	Dump 16 bytes of memory	
h / ?	Show Help	
i	Read & show dynamic configuration values from FPGA	
m <address> [<data>]</data></address>	Read/Write FPGA CR/CSR, Function 0	
r	Reset Board	
S	Save boot configuration & dynamic configuration values into non-	
	volatile memory	
u	Update IP2022 software	
q	Quit Telnet	

Boot Configuration (command b)

Command b displays the current boot configuration parameters of the module. The parameter may be changed by giving a new parameter value. The following parameters are displayed:

Parameter	Description
Use DHCP	0 = use static IP address, 1 = use DHCP to acquire address, net mask
	etc.
IP address	IP address of module
Subnet mask	Subnet mask of module
Default GW	Default gateway
FPGA mode	FPGA configuration mode
	0 – FPGA is not configured after power up

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 22 of 50

	1 – FPGA configured from internal Flash memory	
	2 – FPGA is configured from FTP server	
FTP server	FTP server IP address where configuration bit file resides	
Username	FTP server username	
Password	FTP server password	
FTP Filename	FTP server configuration file name	
Flash Filename	Configuration file name on internal flash	
μs divider	Integer divider to get from event clock to 1MHz, e.g. 125 for	
	124.9135 MHz	
Fractional divider	Micrel SY87739UMI fractional divider configuration word to set	
configuration word	refenrence for event clock	

Note that after changing parameters the parameters have to be saved to internal flash by issuing the Save boot configuration (s) command. The changes are applied only after resetting the module using the reset command or hardware reset/power sequencing.

Memory dump (command d)

This command dumps 16 bytes of memory starting at the given address, if the address is omitted the previous address value is increased by 16 bytes.

The most significant byte of the address determines the function of the access:

Address	Function
0x00000000	CR/CSR space access
0x80000000	EVG registers access

To dump the start of the EVG register map issue the 'd' command from the telnet prompt:

VME-EVG-230 -> d 80000000 ↓

VME-EVG-230 -> d ↓

VME-EVG-230 ->

Memory modify (commands d and m)

The access size is always a short word i.e. two bytes.

To check the status register from the telnet prompt:

VME-EVG-230 -> m 80000000 ↓ Addr 80000000 data d000 VME-EVG-230 ->

To enable the EVG issue:

VME-EVG-230 -> m 80000000 0000 4 Addr 80000000 data 4001

VME-EVG-230 ->

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc **Page:** 23 of 50

Upgrading IP2022 Microprocessor Software (command u)

To upgrade the Ubicom IP2022 microprocessor software download the upgrade image containing the upgrade to the module using TFTP:

Linux

In Linux use e.g. interactive tftp:

```
$ tftp 192.168.1.32
tftp> bin
tftp> put upgrade.bin /fw
tftp> quit
```

Windows

In Windows command prompt issue the following command:

```
C:\> tftp -i 192.168.1.32 PUT upgrade.bin /fw
```

When the upgrade image has been downloaded and verified, enter at the telnet prompt following:

```
VME-EVG-230 → u ↓ Really update firmware (yes/no) ? yes ↓ Self programming triggered.
```

The Event Generator starts programming the new software and restarts.

Upgrading FPGA Configuration File

When the FPGA configuration file resides in internal flash memory a new file system image has to be downloaded to the module. This is done using TFTP protocol:

Linux

In Linux use e.g. interactive tftp:

```
$ tftp 192.168.1.32
tftp> bin
tftp> put filesystem.bin /
tftp> quit
```

Windows

In Windows command prompt issue the following command:

```
C:\> tftp -i 192.168.1.32 PUT filesystem.bin /
```

Now the FPGA configuration file has been upgraded and the new configuration is loaded after next reset/power sequencing.

Note! Due to the UDP protocol it is recommended to verify (read back and compare) the filesystem image before restarting the module. This is done following:

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 24 of 50

Linux

In Linux use e.g. interactive tftp:

```
$ tftp 192.168.1.32
tftp> bin
tftp> get / verify.bin
tftp> quit
$ diff filesystem.bin verify.bin
$
```

If files differ you should get following message: Binary files filesystem.bin and verify.bin differ

Windows

In Windows command prompt issue the following command:

```
C:\> tftp -i 192.168.1.32 GET / verify.bin
C:\> fc /b filesystem.bin verify.bin
Comparing files filesystem.bin and verify.bin
FC: no differences encountered
```

UDP Remote Programming Protocol

The VME-EVG can be remotely programmed using the 10baseT Ethernet interface with a protocol over UDP (User Datagram Protocol) which runs on top of IP (Internet Protocol). The default port for remote programming is UDP port 2000. The UDP commands are built upon the following structure:

access_type (1 byte)	status (1 byte)	data (2 bytes)	
address (4 bytes)			
ref (4 bytes)			

The first field defines the access type:

access_type	Description
0x01	Read Register from module
0x02	Write and Read back Register from module

The second field tells the status of the access:

Status	Description
0	Command OK
-1	Bus ERROR (Invalid read/write address)
-2	Timeout (FPGA did not respond)
-3	Invalid command

The access size is always a short word i.e. two bytes. The most significant byte of the address determines the function of the access:

Address	Function
---------	----------

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 25 of 50

0x00000000	CR/CSR space access
0x80000000	EVG registers access

Read Access (Type 0x01)

The host sends a UDP packet to port 2000 of the VME-EVG with the following contents:

Ī	access_type (1 byte)	status (1 byte)	data (2 bytes)				
		0x00	0x0000				
Ī	address (4 bytes)						
	0x80000000 (Control and Status register Function 0 address)						
Ī	ref (4 bytes)						
	0x00000000						

If the read access is successful the VME-EVG replies to the same host and port the message came from with the following packet:

	access_type (1 byte)	status (1 byte)	data (2 bytes)			
	0x01	0x00	0xD000			
Γ	address (4 bytes)					
	0x80000000 (Control and Status register Function 0 address)					
Γ	ref (4 bytes)					
	0x0000000					

Write Access (Type 0x02)

The host sends a UDP packet to port 2000 of the VME-EVG with the following contents:

access_type (1 byte)	status (1 byte)	data (2 bytes)				
0x02	0x00	0x0001				
Address (4 bytes)						
0x	0x80000002 (Event enable register Function 0 address)					
ref (4 bytes)						
0x0000000						

If the write access is successful the VME-EVG replies to the same host and port the message came from with the following packet:

access_type (1 byte)	status (1 byte)	data (2 bytes)				
0x02	0x00	0x0001				
	address (4 bytes)					
0x	0x80000002 (Event enable register Function 0 address)					
	ref (4 bytes)					
0x0000000						

Notice that in the reply message the data returned really is the data read from the address specified in the address field so one can verify that the data really was written ok.

address	Bit 7	bit 6	bit 5	Bit 4	bit 3	bit 2	bit 1	bit 0
0x013				AC Trigge	r Phase Sh	ift		

Bit Function

ACBYP AC divider and phase shifter bypass (0 = divider/phase shifter enabled, 1

= divider/phase shifter bypassed)

ACSYNC Synchronization select (0 = event clock, 1 = multiplexed counter 7

output)

AC Trigger Mapping Register

address	Bit 7	bit 6	bit 5	Bit 4	bit 3	bit 2	bit 1	bit 0	
0x017	ACM7	ACM6	ACM5	ACM4	ACM3	ACM2	ACM1	ACM0	

Bit	Function
ACM7	If set AC circuit triggers Event Trigger 7
ACM6	If set AC circuit triggers Event Trigger 6
ACM5	If set AC circuit triggers Event Trigger 5
ACM4	If set AC circuit triggers Event Trigger 4
ACM3	If set AC circuit triggers Event Trigger 3
ACM2	If set AC circuit triggers Event Trigger 2
ACM1	If set AC circuit triggers Event Trigger 1
ACM0	If set AC circuit triggers Event Trigger 0

Software Event Register

address	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
0x01A							SWPEND	SWENA
'				II.	I .	l.	•	
address	Bit 7	bit 6	bit 5	Bit 4	bit 3	bit 2	bit 1	bit 0
0x01B				1	to be sent			

Bit Function

SWPEND Event code waiting to be sent out (read-only). A new event code may be

written to the event code register when this bit reads '0'.

SWENA Enable software event

Data Buffer Control Register

address	bit 23	bit 22	bit 21	bit 20	bit 19	bit 18	bit 17	bit 16
0x021				TXCPT	TXRUN	TRIG	ENA	MODE
address	bit 15	Bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
0x022							DTSZ(10:8)
address	Bit 7	bit 6	bit 5	Bit 4	bit 3	bit 2	bit 1	bit 0
0x023			DTS	Z(7:2)			0	0

Bits	Function
TXCPT	Data Buffer Transmission Complete
TXRUN	Data Buffer Transmission Running – set when data
	transmission has been triggered and has not been completed yet
TRIG	Data Buffer Trigger Transmission
	Write '1' to start transmission of data in buffer
ENA	Data Buffer Transmission enable
	'0' – data transmission engine disabled
	'1' – data transmission engine enabled
MODE	Distributed bus sharing mode
	'0' – distributed bus not shared with data transmission
	'1' – distributed bus shared with data transmission
DTSZ(10:8)	Data Transfer size 4 bytes to 2k in four byte increments

Distributed Bus Mapping Register

address	bit 31	bit 30	bit 29	bit 28	bit 27	bit 26	bit 25	bit 24	
0x024		DBMA	P7(3:0)			DBMA	P6(3:0)

address	bit 7					bit 0
0x02F			Versi	on ID		

Bits	Function	
Form Factor	0 – CompactPCI 3U	
	1 – PMC	
	2 – VME64x	
	3 – CompactRIO	

4 – CompactPCI 6U

Microsecond Divider Register

address	bit 15	bit 0
0x04e	Rounded integer value of 1 µs * event cle	ock

For 100 MHz event clock this register should read 100, for 50 MHz event clock this register should read 50. This value is used e.g. for the phase shifter in the AC input logic.

Application Programming Interface (API)

A Linux device driver and application interface is provided to setup up the Event Generator.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 42 of 50

Function Reference

int EvgOpen(struct MrfEgRegs **pEg, char *device_name);

Description Opens the EVG device for access. Simultaneous

accesses are allowed.

Parameters struct MrfEgRegs **pEg EvgOpen returns pointer to EVG registers by

memory mapping the I/O registers into user

space.

char *device_name Holds the device name of the EVG, e.g.

/dev/ega3. The device names are set up by the module_load script of the device driver.

Return value Return file descriptor on success.

Returns -1 on error.

int EvgClose(int fd);

Description Closes the EVG device after opening by

EvgOpen.

Parameters int fd File descriptor returned by EvgOpen

Return value Returns zero on success.

Returns -1 on error.

int EvgEnable(volatile struct MrfEgRegs *pEg, int state);

Description Enables the EVG and allows sending event

codes.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int state 0: disable

1: enable

Return value Returns zero when EVG disabled

Returns non-zero when EVG enabled

int EvgGetEnable(volatile struct MrfEgRegs *pEg);

Description Retrieves state of the EVG.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base

Return value Returns zero when EVG disabled

Returns non-zero when EVG enabled

int EvgRxEnable(volatile struct MrfEgRegs *pEg, int state);

Description Enables/disables the EVG receiver.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int state 0: disable

1: enable

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 43 of 50

Return value Returns zero when RX disabled

Returns non-zero when RX enabled

int EvgRxGetEnable(volatile struct MrfEgRegs *pEg);

Description Retrieves state of the EVG receiver.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value Returns zero when RX disabled

Returns non-zero when RX enabled

int EvgGetViolation(volatile struct MrfEgRegs *pEg, int clear);

Description Get/clear EVG RX link violation status.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int clear 0: don't clear

1: clear status

Return value Returns 0 when no violation detected.

Return non-zero when violation detected.

int EvgSWEventEnable(volatile struct MrfEgRegs *pEg, int state);

Description Enable sending of software event codes.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int state 0: disable

1: enable

Return value Returns zero when EVG SW events disabled

Returns non-zero when EVG SW events

enabled

int EvgGetSWEventEnable(volatile struct MrfEgRegs *pEg);

Description Retrieve state of software event codes.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value Returns zero when EVG SW events disabled

Returns non-zero when EVG SW events

enabled

int EvgSendSWEvent(volatile struct MrfEgRegs *pEg, int code);

Description Send software event code.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base

int code Event code to be sent out

Return value Returns code sent out.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 44 of 50

int EvgEvanEnable(volatile struct MrfEgRegs *pEg, int state);

Description Enable/disable EVG event analyzer.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int state 0: disable

1: enable

Return value Returns zero when EVG event analyzer

disabled

Returns non-zero when EVG SW event

analyzer enabled

int EvgEvanGetEnable(volatile struct MrfEgRegs *pEg);

Description Get EVG event analyzer state.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value Returns zero when EVG event analyzer

disabled

Returns non-zero when EVG SW event

analyzer enabled

void EvgEvanReset(volatile struct MrfEgRegs *pEg);

Description Reset EVG event analyzer state.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value none

void EvgEvanResetCount(volatile struct MrfEgRegs *pEg);

Description Reset EVG event analyzer time counter

value.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

int EvgEvanGetEvent(volatile struct MrfEgRegs *pEg, struct EvanStruct *evan);

Description Retrieve one event from event analyzer.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

struct EvanStruct *evan Pointer to event analyzer structure to store

one event. (see egapi.h for structure details).

Return value Returns zero on success.

Returns -1 if no events available in event

analyzer.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 45 of 50

int EvgSetMXCPrescaler(volatile struct MrfEgRegs *pEg, int mxc, unsigned int presc);

Description Set multiplexed counter prescaler.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int mxc Multiplexed counter number 0-7.

unsigned int presc 32-bit prescaler value. **Return value** Returns zero on success.

Returns -1 on error.

int EvgSetMxcTrigMap(volatile struct MrfEgRegs *pEg, int mxc, int map);

Description Set multiplexed counter to event trigger

mapping.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int mxc Multiplexed counter number 0-7. int map Number of event trigger to map to.

Return valueReturns zero on success.
Returns -1 on error.

void EvgSyncMxc(volatile struct MrfEgRegs *pEg);

Description Synchronize multiplexed counters.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

void EvgMXCDump(volatile struct MrfEgRegs *pEg);

Description Dump multiplexed counter registers.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

int EvgSetDBusMap(volatile struct MrfEgRegs *pEg, int dbus, int map);

Description Set distributed bus bit mappings.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int dbus Distributed bus bit number 0-7. int map Distributed bus bit source:

C_EVG_DBUS_SEL_OFF: bit tied to zero

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 46 of 50

C_EVG_DBUS_SEL_EXT: external input C_EVG_DBUS_SEL_MXC: multiplexed

counter

C_EVG_DBUS_SEL_FORWARD: from

upstream EVG

Return value Returns zero on success.

Returns -1 on error.

void EvgDBusDump(volatile struct MrfEgRegs *pEg);

Description Dump distributed bus registers.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

int EvgSetACInput(volatile struct MrfEgRegs *pEg, int bypass, int sync, int div, int delay);

Description Set AC input parameters.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

oase.

int bypass 0: use AC sync logic

1: bypass phase shifter and divider 0: don't synchronize to MXC7

int sync 0: don't synchronize to MXC

1: synchronize to MXC7

int div Divider 1 - 255

int delay Phase shift in approx. 0.1 ms steps

Return value Returns zero on success.

Returns -1 on error.

int EvgSetACMap(volatile struct MrfEgRegs *pEg, int map);

Description Set AC input event trigger mapping.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int map Number of event trigger to map to.

Return value Returns zero on success.

Returns -1 on error.

void EvgACDump(volatile struct MrfEgRegs *pEg);

Description Dump AC input registers.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 47 of 50

int EvgSetRFInput(volatile struct MrfEgRegs *pEg, int useRF, int div);

Description Set up event clock RF input.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int useRF 0: use internal reference (fractional

synthesizer)

1: use external RF input int div C EVG RFDIV 1,

C_EVG_RFDIV_2, etc. see egapi.h for

details.

Return value Returns zero on success.

Returns -1 on error.

int EvgSetFracDiv(volatile struct MrfEgRegs *pEg, int fracdiv);

Description Set fractional divider control word which

provides reference frequency for receiver.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int fracdiv Fractional divider control word

Return value Returns control word written

int EvgSetSeqRamEvent(volatile struct MrfEgRegs *pEg, int ram, int pos, unsigned int timestamp, int code);

Description Write one event into Sequence RAM.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int ram Number of Sequence RAM

0: RAM0

1: RAM1

int pos Event position in memory: 0 - 2047

unsigned int timestamp Timestamp of event (32-bit)

int code Event code (8-bit)

Return value Returns zero on success.

Returns -1 on error.

void EvgSeqRamDump(volatile struct MrfEgRegs *pEg, int ram);

Description Dump Sequence RAM registers.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

int EvgSeqRamControl(volatile struct MrfEgRegs *pEg, int ram, int enable, int single, int recycle, int reset, int trigsel);

Description Setup Sequence RAM

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 48 of 50

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int ram Number of Sequence RAM

0: RAM0

1: RAM1

int enable 0: disable RAM

1: enable RAM

int single 0: multi-sequence

1: single sequence

int recycle 0: trigger mode

1: recycle mode (loop)

int reset 1: reset RAM int trigsel See egapi.h

Return value Returns zero on success.

Returns -1 on error.

int EvgSeqRamSWTrig(volatile struct MrfEgRegs *pEg, int trig);

Description Software trigger Sequence RAM.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int trig 0: software trigger 0

1: software trigger 1

Return value Returns 0 on success.

Returns -1 on error.

void EvgSeqRamStatus(volatile struct MrfEgRegs *pEg, int ram);

Description Dump Sequence RAM status.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value None

int EvgSetUnivinMap(volatile struct MrfEgRegs *pEg, int univ, int trig, int dbus);

Description Set up universal input mappings.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

int univ Number of universal input (0-3 for EVG, 4-9

for side-by-side module)

int trig Number of event trigger to map to.

int dbus Number of external distributed bus input to

map to.

Return value Returns 0 on success.

Returns -1 on error.

Välitalontie 83 C, FI-00660 Helsinki, Finland

Page: 49 of 50

void EvgUnivinDump(volatile struct MrfEgRegs *pEg);

Description Dump Universal input mappings.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base

Return value None

int EvgSetTriggerEvent(volatile struct MrfEgRegs *pEg, int trigger, int code, int enable);

Description Set up trigger events.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

int trigger Number of trigger event

int code Event code int enable 0: disable

1: enable

Return value Returns 0 on success.

Returns -1 on error.

void EvgTriggerEventDump(volatile struct MrfEgRegs *pEg);

Description Dump Event trigger settings.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

None Return value

int EvgSetUnivOutMap(volatile struct MrfEgRegs *pEg, int output, int map);

Description Set up universal output mappings.

volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register **Parameters**

Universal Output number int output

int map Signal mapping (see egapi.h for details)

Return value Returns 0 on success, -1 on error

int EvgSetDBufMode(volatile struct MrfEgRegs *pEg, int enable);

Description Enable/disable transmitter data buffer mode.

> When data buffer mode is enabled every other distributed bus byte is reserved for data

transmission thus the distributed bus

bandwidth is halved.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

int enable 0 – disable transmitter data buffer mode

1 – enable transmitter data buffer mode

Return value Transmit data buffer status (see **Error!**

Välitalontie 83 C, FI-00660 Helsinki, Finland

Document: EVG-MRM-0003.doc

Page: 50 of 50

Reference source not found. on page **Error! Bookmark not defined.** for bit

definitions).

int EvgGetDBufStatus(volatile struct MrfEgRegs *pEg);

Description Get transmit data buffer status. When data

buffer mode is enabled every other distributed bus byte is reserved for data transmission thus the distributed bus

bandwidth is halved.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base.

Return value Transmit data buffer status (see **Error!**

Reference source not found. on page **Error! Bookmark not defined.** for bit

definitions).

int EvgSendDBuf(volatile struct MrfEgRegs *pEg, char *dbuf, int size);

Description Get transmit data buffer status. When data

buffer mode is enabled every other distributed bus byte is reserved for data transmission thus the distributed bus

bandwidth is halved.

Parameters volatile struct MrfEgRegs *pEg Pointer to memory mapped EVG register

base

char *dbuf Pointer to local data buffer

int size Size of data in bytes to be transmitted:

4, 8, 12, ..., 2048.

Return value Size of buffer being sent.

-1 on error.
